Anesthesia Secrets Anesthesia Outside of the Operating Room is a comprehensive, up-to-date textbook that covers all aspects of anesthesia care in OOR settings, from financial considerations to anesthetic techniques to quality assurance. With increasing numbers of procedures such as cardiac catheterization and imaging taking place outside of the main OR, anesthesia providers as well as non-anesthesia members of the patient care team will find this book critical to their understanding of the principles of anesthesia care in unique settings which may have limited physical resources. Topics include patient monitoring techniques, pre-procedure evaluation and post-procedure care, and procedural sedation performed by non-anesthesia providers. The authors address problems of anesthesia that have unique answers in OOR settings, such as patient transport and cardiac arrest, and discuss technological progress and considerations for the future. The text also covers surgical procedures and anesthetic considerations by procedure location, such as radiology, infertility clinics, field and military environments, and pediatric settings, among many others. Miller's Anesthesia The purpose of this study was to determine the Indirect Care time (including Nonproductive) time) expressed as a proportion of Available time; this eventually will be combined with Direct Care time and Unavailable for Care time to determine nursing requirements consistent with currently accepted nurse staffing standards methodology. To determine the Indirect Care and
Nonproductive proportions for the Army Post Anesthesia Care Unit (PACU) nursing units, a stratified work sampling design was used. Using weighted stratified sampling, the required sample size of nine sites was selected from the low, medium, and high workload strata proportionate to the number of sites from the total universe that occurred within each stratum. Using 5% accuracy (95% confidence interval length) and .65 as an approximation of the Indirect Care time proportion, it was estimated that at least 364 data point per site were required. Actual sample resulted in an accuracy of at least 4.3%. Data collection was distributed over a work cycle for PACU, defined as one week of the measured unit's hours of operation. A minimum of one observation session per hour and a maximum of six observation sessions per hour were scheduled to insure representative sampling of nursing activities throughout the day. Upon analysis of the collected data, it was found that each of the workload stratum-specific proportions was within 3% of the overall combined Indirect Care and Nonproductive time proportions of 76.8%. PeriAnesthesia Nursing Core Curriculum E-Book

Shnider and Levinson's Anesthesia for Obstetrics Poorly managed pain in the immediate postoperative period frequently extends the patient's length of stay in the post anesthesia care unit (PACU) and may lead to increased costs for an organization. Evidence-based clinical practice guidelines are emerging as one means to improve pain management practices. The American Society of PeriAnesthesia Nursing (ASPAN) Pain and Comfort Guidelines were developed to fill the gap for perioperative nursing pain management practices within the perioperative continuum (Krenzischek & Wilson, 2003). The overall
objective of this project is to decrease PACU length of stay (LOS), related to pain, by improving the pain management performance of nurses in the PACU through the implementation of the ASPAN Pain and Comfort Guidelines. The specific aims of this project are to:

Aim 1: Evaluate the impact of implementing the American Society of PeriAnesthesia Nursing (ASPAN) pain and comfort guidelines in a PACU

Aim 2: Compare the differences in patient length LOS stay in the PACU pre and post implementation of the ASPAN pain and comfort guidelines.

Aim 3: Determine the cost-effectiveness of implementing the ASPAN pain and comfort guidelines in the PACU

This pre and post implementation outcome project was conducted in a hospital that performs surgery on, approximately, 800 patients per month. Descriptive statistics was used to analyze the data obtained from this project. The findings show that the overall pain rating at time of discharge decreased post implementation; increase documentation of patient/family pain management education; and there was a decrease in PACU LOS from 2.95 hours pre-implementation to 1.70hrs post-implementation. Furthermore, expansion of this project may lead to a greater realization in cost savings related to a sustained decrease in the LOS.

Standards & Guidelines for Professional Nursing Practice in the Care of Women and Newborns Updated clinical guidelines and professional practice standards for pediatric post-anesthesia care call for the use of capnography until the patient is awake. The purpose of this project was to champion the implementation of capnography in the pediatric post-anesthesia care unit at the project site. Monitoring capnography in addition to pulse oximetry for all pediatric post-anesthesia patients until awake was the practice change implemented. Capnography led to an increase in the number
of appropriate respiratory-related nursing care interventions provided, earlier response to changes in respiratory status, and a decrease in the pediatric post-anesthesia care unit length of stay. The implications for practice include increasing the efficiency and effectiveness of nursing care as well as increasing the affordability of healthcare in the pediatric post-anesthesia care unit.

Decreasing Pain and Length of Stay in the Post Anesthesia Care Unit, (PACU), by Implementing the ASPAN Pain and Comfort Guidelines A practical, symptom-based approach to identifying and managing the common and uncommon post-operative complications encountered in the surgical patient.
